

Dear Subscriber,

This is a monthly update on the GeoPard Agriculture product development. We are glad to release several useful features for you.

Improved Maps Views

We introduce a better look of source imagery in Infrared, RGB and 9 vegetations indices (EVI2, LAI, NDVI, OSAVI, GCI, etc) as well. New look is supported both in GeoPard Agriculture user interface and for API integration to desktop, tablet, mobile applications.

Soil Module

By uploading soil sampling files you get an easy-readable heatmap visualization. In addition, you can delineate management zones based on any attribute, compare them with other layers like historical crop productivity and build variable rate fertilizer prescription files.

Other improvements included:

- Ukrainian language support
- moving to more advanced database solution
- adding satellite image provider label
- possibility to delete field created in not supported area

At these uncertain times, it is important to maintain a physical distance, not a social distance. We should support each other more than ever, using available means of electronic communication. Stay strong.

Sincerely yours,
Vladimir from GeoPard
